

SAFE PULLAWAY

This system can prevent crashes in traffic jams and at intersections, or accidents caused by inadvertent selection of drive instead of reverse. The vehicle's stereo camera detects objects such as vehicles or walls in front: if the system determines that throttle input or gear selection could lead to a collision the brakes are applied automatically.

Together with Autonomous Emergency Braking, Safe Pullaway will help to reduce the number of collisions on our roads and make driving safer.

A common cause of collisions is drivers assuming that the vehicle in front has pulled away – at roundabouts for example.

As the vehicle creeps forward or the driver applies the throttle, the system autonomously applies the brakes and warns the driver.
